

The search for new solutions in the field of materials brings new opportunities for natural polymers. Not only in the field of application - replacement of microplastics, smart fertilizers, new types of products - but also in the field of business models. The integration of various technologies into larger waste recovery units presents entirely new opportunities for the circular economy and new materials. In my presentation, participants will be acquainted with specific case studies: Horizon 2020 Projects, EUROSTAR's project, results of launch of new products from natural polymer PHA.
